Treatment Patterns in Head and Neck Squamous Cell Cancer in France: ARTISTE Study of Cancerology Patient Charts

A.B. Klein,1 H. Wang,1 N. Shire,1 H. Chalubert,2 E.R. Alessandrini,2 S. Descoins,2 P. Medina3

Aim: To describe treatment patterns according to relevant patient demographic and clinical factors among recurrent or metastatic (R/M) HNSCC patients in France using 2015 data.

Methods

Data

- Clinical trial
- Descriptive statistics
- Safety of treatment
- Tumour Response to Treatment
- Conclusions

Results

- Sample Characteristics
- Treatment Patterns
- Safety of the Treatment
- Tumour Response to Treatment
- Conclusions

Conclusions

- The majority of patients (67.7%) were prescribed chemotherapy or targeted therapy alone without any other concomitant treatment (eg, surgery or radiotherapy).
